Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 09/786,436	Applicant(s) WAGNER ET AL.	
	Examiner Brian Whiteman	Art Unit 1635	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 21 February 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 104-110 and 112-114 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 104-110, 112-114 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Art Unit: 1635

DETAILED ACTION

Claims 104-110 and 112-114 are pending.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 104-110 and 112-114 remain rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Claims 104-110 and 112-114, as best understood, are readable on a genus of oligonucleotides 10-50 nucleotide long comprising a sequence chosen from GGGGG, GAGGG, GGGAG, GTGGG, and GGGTG, wherein the oligonucleotide does not comprise a CG dinucleotide to treat tumor in a subject, wherein the genus of oligonucleotides is not claimed in a specific biochemical or molecular structure that could be envisioned by one skilled in the art at the time the invention was made are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The specification contemplates a genus of poly G motifs to co-stimulate cytotoxic T-lymphocytes (CTLs) or natural killer cells (abstract). The claims are directed to using a genus of oligonucleotides with a tumor specific antigen to treat a vertebrate subject having a tumor. The skilled artisan understands that genus reads on antisense, aptamers, oligomer, etc.. There is a variation among species embraced by the claimed genus. For example, the prior art teaches using G-rich oligo aptamers for inhibiting an immune response (WO 98/29430, cited on a PTO-1449). The instant specification does not specifically disclose making and/or using a tumor specific antigen and an oligonucleotides 10-50 nucleotide long comprising a sequence chosen from GGGGG, GAGGG, GGGAG, GTGGG, and GGGTG, wherein the oligonucleotide does not comprise a CG dinucleotide to treat tumor in a subject. The instant specification discloses an oligonucleotide (PZ2, SEQ ID NO: 2) with IL-2 co-stimulates T cells in vitro (Example 7) and PZ2 co-stimulates natural killer cells in vitro (Example 8). The specification further discloses that only single stranded PZ1 (SEQ ID NO: 1), PZ2 (SEQ ID NO: 2), and PZ3 (SEQ ID NO: 3), but not double stranded PZ1, PZ2, and PZ3 co-stimulate T cells in vitro. The specification further discloses:

To analyze the effects of ODN on T cells a costimulation assay was used. In this assay purified T cells are stimulated via their TCR (signal 1). This signal is not sufficient to induce cytokine secretion and subsequent T cell growth (see Figure 9A). Addition of exogenous IL-2 demonstrate that signal 1 is operative. ODN by itself have no stimulatory activity on T cells alone. If however T cells receive a signal via their TCR they become sensitive to ODN. ODN provide to these T cells a potent second signal that induces cytokine secretion (Figure 9B) and T cell growth (Figure

Art Unit: 1635

9A). The results demonstrate that G-motif ODN-costimulated anti-cD3 triggered T cells in a sequence and concentration dependent fashion. The analyses allowed the definition of the minimal ODN motif effective for T cell costimulation. Page 31.

One skilled in the art can envision a sequence with the claimed structure, but would be unable to determine without further experimentation if the sequence had a function that was considered essential for the claimed genus of oligonucleotides. Furthermore, the specification does not disclose how to make a sufficient number of species to represent the genus of claimed oligonucleotides.

The mere contemplation of the claimed genus in the specification is not sufficient to support the present claimed invention directed to a genus of oligonucleotides comprising four contiguous guanines. The claimed invention as a whole is not adequately described if the claims require essential or critical elements, which are not adequately described in the specification and which is not conventional in the art as of applicant's effective filing date. Claiming a genus of oligonucleotides that must possess the biological properties as contemplated by applicants' disclosure without defining what means will do so is not in compliance with the written description requirement. Rather, it is an attempt to preempt the future before it has arrived. (See *Fiers v. Revel*, 25 USPQ2d 1601 (CAFC 1993) and *Regents of the Univ. Calif. v. Eli Lilly & Co.*, 43 USPQ2d 1398 (CAFC, 1997)). Possession may be shown by actual reduction to practice, clear depiction of the invention in a detailed drawing, or by describing the invention with sufficient relevant identifying characteristics such that a person skilled in the art would recognize that the inventor had possession of the claimed invention. Pfaff v. Wells Electronics, Inc., 48 USPQ2d 1641, 1646 (1998). The skilled artisan cannot envision the detailed structure of a genus

Art Unit: 1635

of oligonucleotides that must exhibit the contemplated biological functions, and therefore, conception is not achieved until reduction to practice has occurred, regardless of the complexity or simplicity of the structures and/or methods disclosed in the as-filed specification. Thus, in view of the reasons set forth above, one skilled in the art at the time the invention was made would not have recognized that applicant was in possession of the claimed invention as presently claimed.

Applicant's arguments filed 2/21/07 have been fully considered but they are not persuasive.

In response to applicant's argument that undue experimentation is under enablement and not written description, the argument is not found persuasive because the examiner does not indicate that undue experimentation would be required. The examiner has merely stated that further experimentation would be required, not further undue experimentation would be required. The art of record does not indicate that there a correlation between structure and function for the claimed genus of poly G motifs and tumor specific antigens. See Leitner et al., Current Pharmaceutical Design, 2001, 7:1641-67 and Mempel et al. (Immunology Letters 89, 2003, 47-57). See Capon v. Eshhar, 418 F.3d 1349, 1357, 76 USPQ2d 1078, 1084 (Fed. Cir. 2005).

In response to applicant's argument that applicant has described a genus of molecules, including a poly G motif for use in combination with an antigen for treating cancer (Pages 12-14), the argument is not found persuasive because the argument has already been addressed in the written description rejection. Thus, the argument is not found persuasive for the reasons of record. The disclosure on pages 12-14 is directed to a generic contemplation of poly G motifs and using them in a genus of diseases. See Fujikawa v. Wattanasin, 93 F.3d 1559, 1571, 39

Art Unit: 1635

USPQ2d 1895, 1905 (Fed. Cir. 1996). Also see *Univ. of Rochester v. G.D. Searle & Co.*, 358 F.3d 916, 927, 69 USPQ2d 1886, 1894-95 (Fed. Cir. 2004).

In response to applicant's argument that written description for the claimed method is supported in the specification, which includes 14 examples describing data set forth in 6 tables and 15 figures, the argument is not found persuasive because as stated above, the specification does not disclose support for the claimed method. The examples, tables and figures do not disclose results for the claimed method. The examples or data pertinent to the claimed method are discussed in the written description rejection. The art of record does not indicate that there is no correlation between structure and function for the claimed genus of poly G motifs. See *Leitner et al (supra)*, WO 98/29430, and *Mempel (supra)*.

Applicant argues that:

Applicants are not aware of such a requirement for reduction to practice of an invention to be essential to completion of conception. If the Examiner is aware of some legal source for such a conclusion he is respectfully requested to provide that source to Applicants. Additionally, Applicants have taught in the specification that a class of compounds can be used to treat disease such as cancer. Applicants have fully described the structure of the class of compounds, methods for making the class of compounds, methods for administering the class of compounds and the types of disease that could be treated. It is unclear what teachings are missing.

While it is acknowledged that actual reduction to practice is not required in every case. The legal source is cited in several locations in MPEP 2163 (II. METHODOLOGY FOR DETERMINING ADEQUACY OF WRITTEN DESCRIPTION; i) For Each Claim Drawn to a

Art Unit: 1635

Single Embodiment Or Species: (A) Determine whether the application describes an actual reduction to practice of the claimed invention. Also see *Enzo Biochem*, 323 F.3d at 964, 63 USPQ2d at 1613, *Falkner v. Inglis*, 448 F.3d 1357, 1366, 79 USPQ2d 1001, 1007 (Fed. Cir. 2006), and *Pfaff v. Wells Electronics, Inc.*, 55 U.S. at 66, 119 S.Ct. at 311, 48 USPQ2d at 1646.

Claims 104-110 and 112-114 remain rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Factors to be considered in determining whether a disclosure would require undue experimentation have been summarized in *In re Wands*, 858 F.2d 731, 8 USPQ2d 1400 (Fed. Cir. 1988). They include (1) the quantity of experimentation necessary, (2) the amount of direction or guidance presented, (3) the presence or absence of working examples, (4) the nature of the invention, (5) the state of the prior art, (6) the relative skill of those in the art, (7) the predictability or unpredictability of the art, and (8) the breadth of the claims.

The claims read on using a genus of oligonucleotides comprising a G motif for *in vivo* administration to a genus of vertebrate subjects to treat a genus of tumors. Thus, the claims are considered broad. The claims will therefore be evaluated based upon *in vivo* use of the oligonucleotide.

The test of enablement is whether one skilled in the art could make and use the claimed invention from the disclosures in the application coupled with information known in the art without undue experimentation (*United States v. Teletronics, Inc.*, 8 USPQ2d 1217 (Fed. Cir. 1988)). Whether undue experimentation is required is not based upon a single factor, but rather a

Art Unit: 1635

conclusion reached by many factors. These factors were outlined in *Ex parte Forman*, 230 USPQ 546 (Bd. Pat. App. & Inter. 1986) and again in *In Re Wands* (see above).

The state of the art at the time the application was filed and currently as exemplified by Lipford et al. (*Immunology*, 101:46-52, 2000) teaches that poly-guanosine motifs co-stimulate antigen-reactive CD8 T cells. Lipford teaches that G quartet structures may be involved in T-cell stimulation, because at least four, but not less than four consecutive G bases are conditional for stimulation (page 51). Furthermore, Mempel et al. (*Immunology Letters* 89, 2003, 47-57) teaches, "poly-G-oligodeoxynucleotides does not augment the naturally induced antitumoral CD8-T-cell response in P815 mastocytomas."

The applicant contemplates a genus of poly G motifs to co-stimulate cytotoxic T-lymphocytes (CTLs) or natural killer cells (abstract). The instant claims are directed to using a genus of oligonucleotides with a tumor specific antigen to treat a vertebrate subject having a tumor. The skilled artisan understands that the genus reads on antisense, aptamers, oligomer, etc. with a G motif. There is a variation among species embraced by the claimed genus. For example, the prior art teaches using G-rich oligo aptamers for inhibiting an immune response (WO 98/29430, cited on a PTO-1449). The instant specification does not specifically teach making and/or using a tumor specific antigen and an oligonucleotides 10-50 nucleotide long comprising a sequence chosen from GGGGG, GAGGG, GGGAG, GTGGG, and GGGTG, wherein the oligonucleotide does not comprise a CG dinucleotide to treat tumor in a subject. The applicant teaches an oligonucleotide (PZ2, SEQ ID NO: 2) with IL-2 co-stimulates T cells in vitro (Example 7) and PZ2 co-stimulates natural killer cells in vitro (Example 8). The applicant further teaches that only single stranded PZ1 (SEQ ID NO: 1), PZ2 (SEQ ID NO: 2), and PZ3

Art Unit: 1635

(SEQ ID NO: 3), but not double stranded PZ1, PZ2, and PZ3 co-stimulate T cells in vitro. The applicant further teaches:

To analyze the effects of ODN on T cells a costimulation assay was used. In this assay purified T cells are stimulated via their TCR (signal 1). This signal is not sufficient to induce cytokine secretion and subsequent T cell growth (see Figure 9A). Addition of exogenous IL-2 demonstrate that signal 1 is operative. ODN by itself have no stimulatory activity on T cells alone. If however T cells receive a signal via their TCR they become sensitive to ODN. ODN provide to these T cells a potent second signal that induces cytokine secretion (Figure 9B) and T cell growth (Figure 9A). The results demonstrate that G-motif ODN-costimulated anti-cD3 triggered T cells in a sequence and concentration dependent fashion. The analyses allowed the definition of the minimal ODN motif effective for T cell costimulation. Page 31.

With respect to tumor specific antigens, the prior art of record teaches that as tumor cells grow and die they produce tumor specific antigens (e.g., PSA). See Cancer Medicine: Section 2: Cancer Immunology in PubMed[online] Bethesda, MD USA: United States National Library of Medicine [retrieved on 27 December 2005]. Retrieved from: PubMed. The presence of antibodies to tumor specific antigens is already present in the subject. Tumors have evolved means to resist or hide from immune effector cells with tumor specific antigen. The effectiveness of using tumor specific antigens and genus of oligonucleotides for treating cancer in a patient is considered unpredictable.

The instant specification does not provide a working example of treating a tumor in a vertebrate subject using the method steps recited in the claimed invention. The prior art is absent

Art Unit: 1635

for using a tumor specific antigen with an oligonucleotide 10-50 nucleotides long comprising a sequence chosen from GGGGG, GAGGG, GGGAG, GTGGG, GGGTG, wherein the oligonucleotide does not comprise a CG dinucleotide. The prior art has been directed to stimulating an immune response using an oligonucleotide comprising a CG dinucleotide. The applicant contemplates using the G motif as an adjuvant (page 6). As stated in the specification immune adjuvants are well known in the prior art (page 6). However, the relevance of this data to the treatment of tumors is unclear at best because neither the applicant nor the prior art provide a correlation or nexus between the obtained studies such as those provided by applicant with results the skilled artisan would reasonably expect to see for treating a tumor in a vertebrate subject using the claimed method. See Leitner et al., Current Pharmaceutical Design, 2001, 7:1641-67 and Mempel et al. (Immunology Letters 89, 2003, 47-57). Thus, the specification is not considered enabled for treating a tumor in a subject using the claimed method.

In conclusion, the instant specification and the claims coupled with the art of record, at the invention was made, do not provide sufficient guidance and/or evidence to reasonably enable the claimed invention. Given that oligonucleotides wherein a genus of oligonucleotides with a G motif is employed to treat a tumor in a vertebrate subject was unpredictable at the time the invention was made, and given the lack of sufficient guidance as to a anti-tumor effect produced by any oligonucleotide cited in the claims, one skilled in the art would have to engage in a large quantity of undue experimentation in order to practice the claimed invention based on the applicants' disclosure and the unpredictability of treating a tumor using an oligonucleotide comprising a G motif.

Art Unit: 1635

Applicant's arguments filed 2/21/07 have been fully considered but they are not persuasive.

With respect to applicant's argument that it is unclear on page 6 of the previous office action where the examiner derives support for the conclusion that the claimed method is not enabled in the absence of a CG motif, the statement on page 6 was only reciting of what method was not considered enabled. The enablement rejection is not directed to using a CG motif for the skilled artisan to successfully practice the claimed method.

In response to applicant's argument that the papers cited by the examiner do not support the enablement rejection, the argument is not found persuasive because there is no working example of the claimed method and it was not routine for the skilled artisan to practice the claimed method. The closest art (Leitner) discusses genetic vaccines and DNA adjuvants (CpG oligonucleotides) in cancer. See *In re Wands*, 858 F.2d 731, 737, 8 USPQ2d 1400, 1404 (Fed. Cir. 1988). Mempel is another article directed to the closest prior art.

In response to applicant's argument that Kim et al. 2004, indicates that CpG oligonucleotides in treatment of cancer are not considered unpredictable, the argument is not found persuasive because Kim is directed to one CpG oligonucleotide with an undefined nucleotide sequence and the art of record teaches that there is a variation among species embraced by the oligonucleotide of the claimed method. See WO 98/29430.

In response to applicant's argument that enablement for the claimed method is supported in the specification, which includes 14 examples describing data set forth in 6 tables and 15 figures, the argument is not found persuasive because as stated above, the specification does not provide enablement for the claimed method. The examples, tables and figures do not disclose

Art Unit: 1635

results for the claimed method. The examples or data pertinent to the claimed method are discussed in the enablement rejection. There is no working of the claimed method and the method was not routine to one of skill in the art. The art of record does not indicate that there is no correlation between structure and function for the claimed genus of poly G motifs. See Leitner et al (supra), WO 98/29430, and Mempel (supra).

In response to applicant's arguments against examiner's response to the previous arguments (bottom page 5 to page 7), the arguments are not found persuasive for the reasons of record.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian Whiteman whose telephone number is (571) 272-0764.

Art Unit: 1635

The examiner can normally be reached on Monday through Friday from 6:30 to 4:00 (Eastern Standard Time), with alternating Fridays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Douglas Schultz, SPE – Art Unit 1635, can be reached at (571) 272-0763.

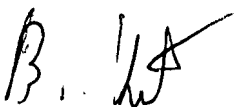

Papers related to this application may be submitted to Group 1600 by facsimile transmission. Papers should be faxed to Group 1600 via the PTO Fax Center. The faxing of such papers must conform with the notice published in the Official Gazette, 1096 OG 30 (November 15, 1989). The Fax Center number is (571) 273-8300.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to (571) 272-0547.

Patent applicants with problems or questions regarding electronic images that can be viewed in the Patent Application Information Retrieval system (PAIR) can now contact the USPTO's Patent Electronic Business Center (Patent EBC) for assistance. Representatives are available to answer your questions daily from 6 am to midnight (EST). The toll free number is (866) 217-9197. When calling please have your application serial or patent number, the type of document you are having an image problem with, the number of pages and the specific nature of the problem. The Patent Electronic Business Center will notify applicants of the resolution of the problem within 5-7 business days. Applicants can also check PAIR to confirm that the problem has been corrected. The USPTO's Patent Electronic Business Center is a complete service center supporting all patent business on the Internet. The USPTO's PAIR system provides Internet-based access to patent application status and history information. It also enables applicants to view the scanned images of their own application file folder(s) as well as general patent information available to the public.

For all other customer support, please call the USPTO Call Center (UCC) at 800-786-9199.
